

Shopify command cheat sheet

Run commands from your theme folder. Select a store with `si <store_abr>`; then omit it.
Replace `<store_abr>` with your alias. Quote theme names with spaces. Check the store with `si`.
A configured defaultStore overrides the remembered store. Store selection is not tied to a folder.

Commands

Command	What it does
<code>si <store_abr></code>	Select a store
<code>si</code>	Show current store and theme
<code>sl</code>	List themes
<code>sd</code>	Start a development theme
<code>sd "My Theme"</code>	Develop a named theme with editor sync
<code>sp</code>	Pull the live theme
<code>sp "My Theme"</code>	Pull a named theme
<code>sp -p</code>	Pull only live template/config JSON
<code>spl "My Theme"</code>	Pull named theme template/config JSON
<code>sp -d</code>	Pull the development theme
<code>spa</code>	Pull live; may delete unmatched local files
<code>sc</code>	Check theme code
<code>sf</code>	Fix supported code issues
<code>lo</code>	Log out of Shopify
<code>shelp</code>	Show help

Options

Option	Example	Meaning
<code>-g / --global</code>	<code>sinit -g</code>	Personal config (setup commands)
<code>-d / --development</code>	<code>sp -d</code>	Development theme (<code>sp</code> , <code>spl</code> , <code>spa</code> , <code>si</code>)
<code>-p PORT / --port PORT</code>	<code>sd -p 9293</code>	Change the development port
<code>-p / --json-only</code>	<code>sp -p</code>	Pull only template/config JSON
<code>-j / --json</code>	<code>sl -j</code>	JSON output (<code>sl</code> , <code>si</code>)
<code>--dry-run</code>	<code>sd "My Theme" --dry-run</code>	Preview without running
<code>-s</code> and <code>-t</code>	<code>sd -s demo -t "My Theme"</code>	Choose store and theme

Store aliases and setup

Command	What it does
<code>sstores</code>	List store aliases
<code>sstores add <store_abr> example-store -g</code>	Add or update an alias
<code>sstores remove <store_abr> -g</code>	Remove an alias
<code>sconfig</code>	Show settings and config locations
<code>sinit</code>	Create a project config
<code>sinit -g</code>	Create personal config (never overwrites)
<code>simport ./base_custom_cli.sh -g</code>	Import legacy store aliases

Important: `sp` overwrites matching files; `spa` may also delete unmatched files. `sd` syncs to the remote theme.
`sf` changes local code. Use `--dry-run` to preview. PowerShell: append `.cmd` (for example, `sp.cmd`).
